

mPowerTools

A Smart Move for Managing Active Directory

Improve your Active Directory game plan - eliminate complex, time-consuming scripting

Some Active Directory tasks are quick and easy, like changing a user's street address. A move this simple just takes a minute, right? Try changing the street address for each user in an entire division, and suddenly you're working all night again. That's why you need **mPowerTools**.

Designed for administrators who want to tackle Active Directory chores in bulk, mPowerTools streamlines the configuration and execution of common IT administrative tasks. An efficient and flexible Search and Replace engine eliminates time spent manually digging through Active Directory to find and change information.

Make the smart move and give your admins more power!

Here are just some of the features that make mPowerTools the ultimate IT administrator's tool:

- Offers three **new** Group Policy Object (GPO) reporting tools and more than 25 GPO reports
- Provides a **new** tool for finding and reporting on Shares throughout your network
- Produces more than 40 **new** common properties and more than 90 new reports
- Provides 2010 Exchange support
- Reset admin passwords on remote workstations and servers
- Import photos en masse into Active Directory
- Access more than 100 preconfigured reports that can also be customized - or create your own, without scripting
- Schedule tasks to be performed at your convenience and on a recurring basis
- Ensure error-free execution through simulation
- Search and replace any attribute value
- Use the custom tools wizard to deliver tools and tasks directly to your team
- Add, modify or delete contacts, users, groups and computers
- Get device-specific information using WMI controls
- Create user home directories (shares) without having to enter each one individually
- Find nested groups

Find and Report on all the GPOs in Your Network

The new GPO reporting tool finds all of the GPOs in your network and tells you where they are linked, their status, who has permissions over them, and more!

"What really grabbed my attention from day one was how quickly I was able to remove 500 user folders and profiles from one of our servers; these were users that had left in the last year. This would have taken around a day to script and possibly just as long to test before deploying. I achieved the task with mPowerTools in less than 15 minutes even though I was not familiar with the product. "

Mian, Technical Support
UK Healthcare Trust operating two hospitals
Approximately 6,900 employees

Control the board, master Active Directory.

Minimum Requirements:

- PC running any of the following:
 - Microsoft Windows 2000 Professional, Server or Advance Server
 - Windows Server 2003
 - Windows XP
 - Windows Vista
- Connection to a Windows 2000/2003 network
- 128 MB of RAM
- 75 MB of disk space

Completes Numerous Tasks in One Single Execution

Whether you're adding users, deleting or disabling user accounts, resetting passwords, modifying AD attributes, or configuring Exchange mailboxes, mPowerTools does it all in a snap. This tool allows you to import user names from various sources such as spreadsheet files or from the built-in Reporting Tools, and you can always use mPowerTools to browse through Active Directory to select users.

Delivers Customized Reports

A custom reporting tool easily enables you to construct and filter data in AD. mPowerTools provides several standard reports that can be customized to fit your environment, or you can create your own reports from scratch. Perhaps you want a customized report on expired or inactive users, thus simplifying the process of locating and deleting unused accounts.

You can also report on items such as the size/message counts in a user's mailbox (inbox, sent, deleted), or, by utilizing the functionality of WMI, you can gather system-specific information like BIOS, processor and adapter properties, service packs installed and numerous other OS and hardware related properties.

The output report can be imported directly back into mPowerTools allowing you to take immediate action on any issue or concern that was uncovered by the report. With mPowerTools, you won't be stuck using troublesome scripts or relying on a third-party reporting tool.

Schedule Execution During Off-peak Hours

Administrators and networks aren't always free at the same time. mPowerTools allows you to perform tasks when it's convenient for you, and then schedule those tasks for distribution over the network during off-peak hours. Logs created during execution confirm the tasks were performed.

Ensures Error-Free Execution Through Simulation

mPowerTools simulation mode allows you to validate all your data before a job is executed. If there is an error in the data, the cursor will move to the erroneous field and a warning message will be displayed. Designed to expose problems such as incorrect access rights without actually performing the requested action, mPowerTools ensures that no errors will occur when the task is executed.

Simple, Task-Oriented Graphic User Interface

mPowerTools provides the user with a Tools Selection Bar that identifies tasks such as Add User, Reports, Delete User, and Reset Password. By selecting the appropriate tool and saved configurations, the user has little to do prior to executing the tasks, streamlining the entire process.

Ensures Seamless Help Desk Delegation of Common Tasks

Whether you are adding users or resetting passwords, mPowerTools provides you with a simple, secure interface to delegate your most common tasks, freeing up your skilled administrators. You can rest easy knowing that the interface locks down tools and fields, allowing only the tasks you hand off to be executed. You can even set mandatory entry fields, ensuring that all pertinent information is entered for every task. And for troubleshooting later on, you will be able to retrace all of the steps taken through event-driven audit logs.
